

Eastern DataComm brings you the latest in fluid communication technology with Cellular Repeaters.

Enhance your wired and wireless solutions within your buildings by using cellular repeaters.

Cellular repeaters move cell signals through your buildings so that areas that don't typically have the best coverage (stairwells, concrete parking structures, and poor reception corners in your older buildings) can receive optimal coverage.

Using cellular repeaters ensures that mobile devices and other wireless solutions work as efficiently and effectively as possible.

Cellular repeaters also help you prevent issues with:

 Wireless dead zones

 Loss of call clarity

 Dropped or interrupted calls

 Slow cell data transfers

Make a world of difference by ensuring your organization is operating with total coverage and a scalable solution that can grow with you.

When you work with the Eastern DataComm team, rest assured knowing that your technology ecosystem keeps your community fully connected and protected. We offer these **essential solutions** to our **clients across New Jersey, Connecticut, and downstate New York.**

Addressing Coverage Challenges

Dead zones can lead to difficulties when it comes to emergency response as well as day-to-day communications like announcements, phone calls, and other wireless communications. At Eastern DataComm, we'll assist you with identifying areas of vulnerability. Our team of expert technicians will integrate cellular repeaters with your other **communications and safety solutions** so everything works together seamlessly.
